Motivation

How to model that in propositional logic?

- All logicians are rational
- Some philosophers are not rational
- Thus, not all philosophers are logicians

Introduction ○●○	Predicate Logic		Existential Quantifiers	
Motiva	tion			

How to model that in propositional logic?

All logicians are rational aLr
 Some philosophers are not rational ¬ sPr
 Thus, not all philosophers are logicians ¬aPL
 conclusion

(We could have also used p, q, and r above, the names above were chosen to have more "speaking" names.)

Introduction ○●○	Predicate Logic		Existential Quantifiers	
Motiva	tion			

How to model that in propositional logic?

- All logicians are rational aLr
 Some philosophers are not rational ¬ sPr
 Thus, not all philosophers are logicians ¬aPL
 conclusion
- So, can we prove aLr, $\neg sPr \vdash \neg aPL$?
 - No! It's even three completely different propositions!
 - We need a more expressive logic!

(We could have also used p, q, and r above, the names above were chosen to have more "speaking" names.)

Introduction

Natural Deductio

Universal Quantifier

Terminology And Conventions: Terminology

- Term: Anything that represents an object, i.e.,
 - a constant (representing a fixed object, like the person Socrates)
 - a variable (representing a non-specified object)
 - a function (representing a fixed object given a sequence of terms)

Intuition:

- Constants are meant to represent concrete objects, as in "isGoat(Socrates)".
- Variables are used for "more general" relationships as in: "All logicians are rational". They are basically placeholders.

Terminology And Conventions: Terminology

Predicate Logic

- Term: Anything that represents an object, i.e.,
 - a constant (representing a fixed object, like the person Socrates)
 - a variable (representing a non-specified object)
 - a function (representing a fixed object given a sequence of terms)

Predicates: Express properties or relations of/between terms:

- Takes as input (or "argument") a sequence of terms.
 - The sequence length depends on the predicate, e.g., *isGoat* is unary, *kicks* is binary, etc. (some might even be nullary!)
 - This length is called *arity* and can be given as a subscript, e.g., *isGoat*₁, *kicks*₂, but we don't since it's clear from context.
- Maps to a truth value, e.g., *isGoat(Socrates)* might be false, but *isGoat(Jimmy)* might be true.
- ⇒ The "formal semantics" (e.g., for which terms is a predicate true?) will be given in week 7.

Terminology And Conventions: Conventions

- We continue to use our sequent notation!
 - *X* ⊢ *A*
 - $X, Y \vdash A$
 - *X*, *A* ⊢ *B*
 - etc. Only now they represent first-order predicate logic formulae.
- As before we write only single letters!
 - X, Y, Z for sets of formulae, and
 - A, B, C for *single* formulae.

xistential Quantifiers

Summary 00

Terminology And Conventions: Conventions (cont'd)

• Capital letters are predicate symbols: *F*, *G*, *H*, ..., *P*, *Q*, *R*, *L*, ...

tion Predicate Logic Natural Deduction

Terminology And Conventions: Conventions (cont'd)

- Capital letters are predicate symbols:
 - $F, G, H, \ldots, P, Q, R, L, \ldots$
- Lower-case letters represent terms:
 - *a*, *b*, *c* are (usually) used for constants, but we also use them for free variables (as they behave in the same way).
 - f, g, h are used for functions.
 - *v* and *x*, *y* are used for variables.
 - *t* is used for terms (i.e., any of the above).

Terminology And Conventions: Conventions (cont'd)

- Capital letters are predicate symbols:
 - $F, G, H, \ldots, P, Q, R, L, \ldots$
- Lower-case letters represent terms:
 - *a*, *b*, *c* are (usually) used for constants, but we also use them for free variables (as they behave in the same way).
 - f, g, h are used for functions.
 - *v* and *x*, *y* are used for variables.
 - *t* is used for terms (i.e., any of the above).
- For the sake of simplicity, we do not use parentheses, e.g., F(a), G(b), and R(a, b) become Fa, Gb, and Rab, respectively.
- Now it's clear that the arity is clear from the context! E.g.,
 - Fa represents a predicate F with arity 1 (with term a), and
 - *Rab* represents a predicate *R* with arity 2 (with terms *a* and *b*).

- All vulcans are logicians.
- Let's reformulate that step by step:

First-Order Formulae: Introduction

- All vulcans are logicians.
- Let's reformulate that step by step:
 - Take any vulcan, call it x, then x is a logician. (x is a variable!)

Itroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers

First-Order Formulae: Introduction

- All vulcans are logicians.
- Let's reformulate that step by step:
 - Take any vulcan, call it x, then x is a logician. (x is a variable!)
 - Take any vulcan, call it *x*, then *Lx*.

First-Order Formulae: Introduction

- All vulcans are logicians.
- Let's reformulate that step by step:
 - Take any vulcan, call it x, then x is a logician. (x is a variable!)
 - Take any vulcan, call it *x*, then *Lx*.
 - For every object *x*, such that *x* is a Vulcan, *Lx* holds.

First-Order Formulae: Introduction

- All vulcans are logicians.
- Let's reformulate that step by step:
 - Take any vulcan, call it x, then x is a logician. (x is a variable!)
 - Take any vulcan, call it *x*, then *Lx*.
 - For every object *x*, such that *x* is a Vulcan, *Lx* holds.
 - For every object *x*, such that *Vx* holds, *Lx* holds.

First-Order Formulae: Introduction

- All vulcans are logicians.
- Let's reformulate that step by step:
 - Take any vulcan, call it x, then x is a logician. (x is a variable!)
 - Take any vulcan, call it *x*, then *Lx*.
 - For every object *x*, such that *x* is a Vulcan, *Lx* holds.
 - For every object *x*, such that *Vx* holds, *Lx* holds.
- Now we need special syntax for that "every object"!

 Even more formally: <u>V</u> (<u>x</u> : <u>Vx</u>)Lx
 guantity indicator variable sort indicator

What other quantifiers could possibly exist?

- SOME(x : Vx)Ex ("some vulcans are emotional")
- FEW(x : Vx)Ex ("a few vulcans are emotional")

Predicate Logic

We want to "quantify" the objects we talk about.

- For every object x, such that Vx holds, Lx holds.
- More formally: <u>ALL(x : Vx)</u> Lx quantifier!
 Even more formally: <u>V</u> (<u>x</u> : <u>Vx</u>)Lx
 guantity indicator variable sort indicator

What other quantifiers could possibly exist?

- SOME(x : Vx)Ex ("some vulcans are emotional")
- FEW(x : Vx)Ex ("a few vulcans are emotional")
- $MOST(x : Lx) \neg Vx$ ("most logicians are not vulcans")

Predicate Logic

We want to "quantify" the objects we talk about.

- For every object x, such that Vx holds, Lx holds.
- More formally: <u>ALL(x : Vx)</u> Lx quantifier!
 Even more formally: <u>V</u> (<u>x</u> : <u>Vx</u>)Lx
 guantity indicator variable sort indicator

What other quantifiers could possibly exist?

- SOME(x : Vx)Ex ("some vulcans are emotional")
- FEW(x : Vx)Ex ("a few vulcans are emotional")
- MOST(x : Lx)¬Vx ("most logicians are not vulcans")
- $ONE(x : Lx)(Ex \land Vx)$ ("One logician is an emotional vulcan")

Predicate Logic

We want to "quantify" the objects we talk about.

- For every object x, such that Vx holds, Lx holds.
- More formally: <u>ALL(x : Vx)</u> Lx quantifier!
 Even more formally: <u>V</u> (<u>x</u> : <u>Vx</u>)Lx
 guantity indicator variable sort indicator

What quantifiers do exist? (In our predicate logic!)

- Just two!
- ALL(x : A)B, i.e., $\forall (x : A)B$
- SOME(x : A)B, i.e., ∃(x : A)B

"SOME" means "at least one", so " \exists " is also called "exists" "ALL", i.e., \forall , is called the "universal" quantifier

- $\exists (x:Gx) \forall (y:Hy \land Fy) Kyx$
- Are these the same?

Itroduction Predicate Logic Natural Deduction Universal Quar

Examples: More Complicated Examples

• Every hairy footballer kicks a goat.

- $\forall (x : Hx \land Fx) \exists (y : Gy) Kxy$
- $\exists (x:Gx) \forall (y:Hy \land Fy) Kyx$
- Are these the same?
- In the first formula, each footballer may kick his/her own goat!
 In the second, all footballers kick the same goat!*
 - * I claim that this model is *wrong*! This is not what the sentence is saying; the second formula is more/too specific.

Examples: More Complicated Examples

- Every hairy footballer kicks a goat.
 - $\forall (x : Hx \land Fx) \exists (y : Gy) Kxy$
 - $\exists (x:Gx) \forall (y:Hy \land Fy) Kyx$
 - Are these the same?
 - In the first formula, each footballer may kick his/her own goat!
 In the second, all footballers kick the same goat!*
 - * I claim that this model is *wrong*! This is not what the sentence is saying; the second formula is more/too specific.
- Only hairy footballers kick goats.
 - $\forall (x : Fx \land \exists (y : Gy) Kxy) Hx$

Examples: More Complicated Examples

- Every hairy footballer kicks a goat.
 - $\forall (x : Hx \land Fx) \exists (y : Gy) Kxy$
 - $\exists (x:Gx) \forall (y:Hy \land Fy) Kyx$
 - Are these the same?
 - In the first formula, each footballer may kick his/her own goat!
 In the second, all footballers kick the same goat!*
 - * I claim that this model is *wrong*! This is not what the sentence is saying; the second formula is more/too specific.
- Only hairy footballers kick goats.
 - $\forall (x : Fx \land \exists (y : Gy)Kxy)Hx$
 - $\forall (x : \exists (y : Gy) Kxy) (Hx \land Fx)$

Examples: More Complicated Examples

- Every hairy footballer kicks a goat.
 - $\forall (x : Hx \land Fx) \exists (y : Gy) Kxy$
 - $\exists (x:Gx) \forall (y:Hy \land Fy) Kyx$
 - Are these the same?
 - In the first formula, each footballer may kick his/her own goat!
 In the second, all footballers kick the same goat!*

* I claim that this model is *wrong*! This is not what the sentence is saying; the second formula is more/too specific.

- Only hairy footballers kick goats.
 - $\forall (x : Fx \land \exists (y : Gy) Kxy) Hx$
 - $\forall (x : \exists (y : Gy) Kxy) (Hx \land Fx)$
 - The first model means: "All footballers that kick a goat are hairy." The second: "Anything that kicks a goat is a hairy footballer." But which one is right? (Hard to tell, language is vague!)

Examples: Note on Interpreting Natural Language

- Modeling a proposition with logic often reveals how vague language is! (And that we may make implicit assumptions)
- Only hairy footballers kick goats." What is meant here?
 - Among all footballers, only the hairy ones kick goats.
 - Among all human beings, only hairy footballers kick goats.

Examples: Note on Interpreting Natural Language

- Modeling a proposition with logic often reveals how vague language is! (And that we may make implicit assumptions)
- Only hairy footballers kick goats." What is meant here?
 - Among all footballers, only the hairy ones kick goats.
 - Among all human beings, only hairy footballers kick goats.
- "Only unmotivated students don't study." What is meant here?
 - Among all students, only the unmotivated ones don't study.
 - Among all *human beings* (or all aliens, spirits, ...?), only unmotivated students don't study.

Examples: Note on Interpreting Natural Language

- Modeling a proposition with logic often reveals how vague language is! (And that we may make implicit assumptions)
- Only hairy footballers kick goats." What is meant here?
 - Among all footballers, only the hairy ones kick goats.
 - Among all human beings, only hairy footballers kick goats.
- Only unmotivated students don't study." What is meant here?
 - Among all students, only the unmotivated ones don't study.
 - Among all *human beings* (or all aliens, spirits, ...?), only unmotivated students don't study.
- We normally rely on context to figure out what's meant. But when you are (t)asked to formalize something you need to be as formal as possible.

Anyone who sees a hairy footballer sees someone who kicks a non-footballer.

Sounds horribly complicated, but let's do it step by step!

Anyone who sees a hairy footballer sees someone who kicks a non-footballer.

Sounds horribly complicated, but let's do it step by step!

 ↓ ∀(x : x sees a hairy footballer) (x sees someone who kicks a non-footballer)

troduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers

Examples: Translating a Natural Language Text into Predicate Logics

Anyone who sees a hairy footballer sees someone who kicks a non-footballer.

Sounds horribly complicated, but let's do it step by step!

 $\forall (x : x \text{ sees a hairy footballer}) \\ (x \text{ sees someone who kicks a non-footballer})$

$$\forall (x : \exists (y : Hy \land Fy)Sxy) \\ (\exists (y : y \text{ kicks a non-footballer})Sxy$$

troduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers

Examples: Translating a Natural Language Text into Predicate Logics

Anyone who sees a hairy footballer sees someone who kicks a non-footballer.

Sounds horribly complicated, but let's do it step by step!

 ∀(x : x sees a hairy footballer) (x sees someone who kicks a non-footballer)
 ∀(x : ∃(y : Hy ∧ Fy)Sxy) (∃(y : y kicks a non-footballer)Sxy)
 ∀(x : ∃(y : Hy ∧ Fy)Sxy)

$$(\exists (y: \exists (z: \neg Fz) Kyz) Sxy)$$

Examples: Translation: More examples! (From You)

Novel/recent idea:

- We create a new forum for the formalization of Natural Language!
- We can use it to create some examples to practice this!
- One thread will be one Natural Language
 plus the attempt(s) to formalize it!
- Feedback can be provided by other students; and maybe occasionally by Lecturers
- The idea is basically an asynchronious online learning group
- And some of the completed/correct (most funny?) examples could be preserved for next generations!
- (I'm thinking of additional bonus material just like the many practice sequents in the Logic Notes; see the link in the bonus material sequence.)

Well-formed Formulae: Restrictions on Formulae, cont'd

Recap of Propositional Logic:

- Wellformed formula: (p ∨ q) → (p ∧ q) (though it's not a tautology/theorem, but that's not the point)
- Non-wellformed formula: $(
 ho \lor
 ightarrow q) \land q \neg)$

So what about Predicate Logic?

- Connectives and subformulae are used in the same way as for Propositional Logic.
- Some additional restrictions (next slide)

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summ

Predicate Logic:

- Example for two well-formed formulae:
 - $\forall (x : Fx) \exists (y : Gy) Kxy$
 - $\exists (x : Fx) \exists (y : Gy) Kxy$

Each footballer kicks a goat Some footballer kicks a goat

- What about $(\forall (x : Fx) \exists (y : Gy) Kxy) \land (\exists (x : Fx) \exists (y : Gy) Kxy)?$
 - \rightarrow Still allowed! After all, you can put them together with $\wedge I!$

Predicate Logic:

- Example for two well-formed formulae:
 - $\forall (x : Fx) \exists (y : Gy) Kxy$
 - $\exists (x : Fx) \exists (y : Gy) Kxy$

Each footballer kicks a goat Some footballer kicks a goat

- What about $(\forall (x : Fx) \exists (y : Gy) Kxy) \land (\exists (x : Fx) \exists (y : Gy) Kxy)?$
 - ightarrow Still allowed! After all, you can put them together with \wedge /!
- So, are there any restrictions?
 - Let A and B (well-formed) formulae and x free in A or B, then
 - ► \forall (*x* : *A*)*B* and \exists (*x* : *A*)*B* are (well-formed) formulae.
 - I.e., we don't allow quantification over non-used variables!
 - (We don't provide a complete specification of what's well-formed, just as we didn't for propositional logic.)

Introduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quanti Predicate Logic Natural Deduction Universal Quantifiers Existential Quanti Prom Restricted Quantifiers to Unrestricted Quantifiers: Main Idea

So far, we were only considering restricted quantifiers:

∃(x : Px)¬Rx (Some philosophers are not rational)
∀(x : Lx)Rx (All logicians are rational)

But now - to make life easier! - we don't make restrictions anymore!

From Restricted Quantifiers to Unrestricted Quantifiers: Main Idea

So far, we were only considering restricted quantifiers:

∃(x : Px)¬Rx (Some philosophers are not rational)
 ∀(x : Lx)Rx (All logicians are rational)

But now - to make life easier! - we don't make restrictions anymore!

We cheat to get around having a sort restriction: $\exists (x : x \text{ is a thing})Gx$ is the same as $\exists (x : Fx \rightarrow Fx)Gx$

From Restricted Quantifiers to Unrestricted Quantifiers: Main Idea

So far, we were only considering restricted quantifiers:

∃(x : Px)¬Rx (Some philosophers are not rational)
 ∀(x : Lx)Rx (All logicians are rational)

But now - to make life easier! - we don't make restrictions anymore!

We cheat to get around having a sort restriction: $\exists (x : x \text{ is a thing})Gx$ is the same as $\exists (x : Fx \rightarrow Fx)Gx$

Example:

Something is hairy:

Predicate Logic

00000ĭ00000000

- $\exists (x : Fx \to Fx) Hx$
- So we could also just write ∃x Hx

From Restricted Quantifiers to Unrestricted Quantifiers: Main Idea

So far, we were only considering restricted quantifiers:

∃(x : Px)¬Rx (Some philosophers are not rational)
∀(x : Lx)Rx (All logicians are rational)

But now - to make life easier! - we don't make restrictions anymore!

We cheat to get around having a sort restriction: $\exists (x : x \text{ is a thing})Gx$ is the same as $\exists (x : Fx \rightarrow Fx)Gx$

Example:

Something is hairy:

Predicate Logic

000000000

- $\exists (x : Fx \to Fx) Hx$
- So we could also just write ∃x Hx

- Some goats are hairy:
 - $\exists (x:Gx)Hx$
 - So we can just write $\exists x \ Gx \land Hx$

From Restricted Quantifiers to Unrestricted Quantifiers: Eliminating Sort Indicator

Did we lose something when switching to unrestricted quantifiers?

No! (So, we can just use unrestricted logic instead!)

Did we lose something when switching to unrestricted quantifiers?

No! (So, we can just use unrestricted logic instead!)

Existential quantified formulae become conjunctions:
 E.g., ∃(x : Gx)Hx (some goats are hairy) becomes ∃x Gx ∧ Hx

Did we lose something when switching to unrestricted quantifiers?

No! (So, we can just use unrestricted logic instead!)

- Existential quantified formulae become conjunctions: E.g., $\exists (x : Gx)Hx$ (some goats are hairy) becomes $\exists x \ Gx \land Hx$
- Universally quantified formulae become implications: E.g., $\forall (x : Gx) Hx$ (all goats are hairy) becomes $\forall x \ Gx \rightarrow Hx$

Did we lose something when switching to unrestricted quantifiers?

No! (So, we can just use unrestricted logic instead!)

- Existential quantified formulae become conjunctions: E.g., $\exists (x : Gx)Hx$ (some goats are hairy) becomes $\exists x \ Gx \land Hx$
- Universally quantified formulae become implications: E.g., $\forall (x : Gx)Hx$ (all goats are hairy) becomes $\forall x \ Gx \rightarrow Hx$

Thus, from now on, we will use non-restricted formulae instead. (But in the second half of the course we will re-visit restricted quantifiers again.)

Introduction	Predicate Logic	Natural Deduction ●○○○		
--------------	-----------------	---------------------------	--	--

Natural Deduction

Introduction

- Instead of re-doing all our previous rules, we will just provide additional ones!
 - Two new rules for \forall (introduction and elimination)
 - Two new rules for ∃ (introduction and elimination)
- We still perform natural deduction for *propositional logic* in intermediate steps.

Our Natural Deduction rules will exploit substitutions.

Definition:

- Let A be a formula and t_1 and t_2 be terms.
- $A_{t_2}^{t_1}$ is the result of substituting each *free* (*unbound*) t_2 in A by t_1 .

Substitutions: Introduction

Our Natural Deduction rules will exploit substitutions.

Definition:

- Let A be a formula and t_1 and t_2 be terms.
- $A_{t_2}^{t_1}$ is the result of substituting each free (unbound) t_2 in A by t_1 .
- Any mnemonic? How do I remember what gets substituted by what?
 - Gravity falls!
 - $A_{t_2}^{t_1}$ is the result of A after the t_1 "fell down" crushing t_2 .

Natural Deductio

Universal Quantifiers

Existential Quantifier

Summary

Substitutions: Examples (and Conventions)

• Let
$$A = \exists x (Px \rightarrow Rx)$$
. Is $A_x^y = \exists y (Py \rightarrow Ry)$?

Natural Deduction

Universal Quantifiers

Substitutions: Examples (and Conventions)

• Let
$$A = \exists x (Px \rightarrow Rx)$$
. Is $A_x^y = \exists y (Py \rightarrow Ry)$?

- No! Recall that x is required to be free/unbound in A!
- Since there are no free variables, so $A_x^y = A$ here.

ntroduction

Natural Deduction

Universal Quantifiers

Substitutions: Examples (and Conventions)

• Let
$$A = \exists x (Px \rightarrow Rx)$$
. Is $A_x^y = \exists y (Py \rightarrow Ry)$?

- No! Recall that x is required to be free/unbound in A!
- Since there are no free variables, so $A_x^{y} = A$ here.
- Let $A = Fx \land \exists x (Fx \land Gx)$. What's A_x^y now?
 - It's $Fy \land \exists x(Fx \land Gx)!$
 - Because we only substitute free/unbound variables!

Substitutions: Examples (and Conventions)

• Let $A = \exists x (Px \rightarrow Rx)$. Is $A_x^y = \exists y (Py \rightarrow Ry)$?

Natural Deduction

- No! Recall that x is required to be free/unbound in A!
- Since there are no free variables, so $A_x^y = A$ here.
- Let $A = Fx \land \exists x (Fx \land Gx)$. What's A_x^y now?
 - It's $Fy \land \exists x (Fx \land Gx)!$
 - Because we only substitute free/unbound variables!
- You won't have to take much care as we will use a convention to use the constant letters *a*, *b*, *c* for free variables in all our proofs.
- E.g., you might see something like A = Fa ∧ ∃x(Fx ∧ Gx), but *never* something like Fx ∧ ∃x(Fx ∧ Gx) or even ∃a(Fa ∧ Ga).

Substitutions: Examples (and Conventions)

• Let $A = \exists x (Px \to Rx)$. Is $A_x^y = \exists y (Py \to Ry)$?

Natural Deduction

- No! Recall that x is required to be free/unbound in A!
- Since there are no free variables, so $A_x^y = A$ here.
- Let $A = Fx \land \exists x (Fx \land Gx)$. What's A_x^y now?
 - It's $Fy \land \exists x (Fx \land Gx)!$
 - Because we only substitute free/unbound variables!
- You won't have to take much care as we will use a convention to use the constant letters *a*, *b*, *c* for free variables in all our proofs.
- E.g., you might see something like A = Fa ∧ ∃x(Fx ∧ Gx), but *never* something like Fx ∧ ∃x(Fx ∧ Gx) or even ∃a(Fa ∧ Ga).
- We use this because constants "behave" just like free variables. In fact, the Logic notes never even use free variables! It only uses bound variables and constants (called *names* there).

Natural Deduction

Universal Quantifiers

xistential Quantifiers

Summary

Universal Quantifiers

 Let's assume we want to say that the age of all humans is smaller than 130: ∀x age(x) < 130

 Let's assume we want to say that the age of all humans is smaller than 130: ∀x age(x) < 130

Universal Quantifiers

If we had one constant for each individual (person), we could conclude: age(a) < 130 \langle age(b) < 130 \langle age(c) < 130 \langle ... (Though that's clearly not practical! And maybe not even possible if we reason about infinitely many objects like numbers.)

 Let's assume we want to say that the age of all humans is smaller than 130: ∀x age(x) < 130

Universal Quantifiers

- If we had one constant for each individual (person), we could conclude: age(a) < 130 \langle age(b) < 130 \langle age(c) < 130 \langle ...
 (Though that's clearly not practical! And maybe not even possible if we reason about infinitely many objects like numbers.)
- So we could also conclude age(x) < 130 for any x!
 We thus use a (free) variable in our rule!

- Let's assume we want to say that the age of all humans is smaller than 130: ∀x age(x) < 130
- If we had one constant for each individual (person), we could conclude: *age(a)* < 130 \langle *age(b)* < 130 \langle *age(c)* < 130 \langle ...
 (Though that's clearly not practical! And maybe not even possible if we reason about infinitely many objects like numbers.)
- So we could also conclude age(x) < 130 for any x!
 We thus use a (free) variable in our rule!
- So, what will the Universal-Elimination rule look like?

$$\frac{\forall x \ Fx}{Fv} \forall E \qquad \text{more general:} \qquad \frac{\forall x \ A}{A_x^t} \forall E$$

We do however need a side condition here to make sure our newly introduced term doesn't cause trouble.

Assume we had no side condition:

$$\frac{X \vdash \forall x A}{X \vdash A_x^t} \forall E$$

Universal Quantifiers

Let's consider this sequent: $\forall x \exists y(y > x) \vdash \exists y(y > y)$

Should that be valid? No! No number is larger than itself!

Assume we had no side condition:

 $\frac{\forall x A}{A_x^t} \forall E$ in sequent notation:

$$\frac{X \vdash \forall x \ A}{X \vdash A_x^t} \forall E$$

Let's consider this sequent: $\forall x \exists y(y > x) \vdash \exists y(y > y)$

- Should that be valid? No! No number is larger than itself!
- But we can prove it! (If there's no side condition!)

$$\alpha_1$$
 (1) $\forall x \exists y(y > x)$ A

tural Deduction

Universal Quantifiers

Existential

Assume we had no side condition:

 $\frac{\forall x A}{A_x^t} \forall E$ in sequent notation:

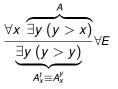

$$\frac{X \vdash \forall x \ A}{X \vdash A_x^t} \forall E$$

Universal Quantifiers

Let's consider this sequent: $\forall x \exists y(y > x) \vdash \exists y(y > y)$

- Should that be valid? No! No number is larger than itself!
- But we can prove it! (If there's no side condition!)

$$\begin{array}{lll} \alpha_1 & (1) & \forall x \ \exists y(y > x) & \mathsf{A} \\ \alpha_1 & (2) & \exists y(y > y) & 1 \ \forall E \end{array}$$

Assume we had no side condition:

 $\frac{\forall x A}{A_x^t} \forall E$ in sequent notation:

$$\frac{X \vdash \forall x \ A}{X \vdash A_x^t} \forall E$$

Universal Quantifiers

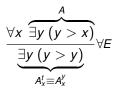

Let's consider this sequent: $\forall x \exists y(y > x) \vdash \exists y(y > y)$

- Should that be valid? No! No number is larger than itself!
- But we can prove it! (If there's no side condition!)

So what's missing?

- The "instantiation of x" (the new variable name) must be free! (We don't want it to get captured by another quantifier!)
- This is different from what we demanded for substitutions.

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summar

So, in conclusion:

Universal Elimination Rule:

$$\frac{X \vdash \forall x A}{X \vdash A_x^t} \forall E \quad \text{only if } t \text{ is not bound in } A_x^t!$$

As mentioned earlier (slide 23), you are not in risk of making that mistake as long as you adhere our convention: use *a*, *b*, *c*, for free variables!

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summa

So, in conclusion:

Universal Elimination Rule:

$$\frac{X \vdash \forall x A}{X \vdash A_x^t} \forall E \quad \text{only if } t \text{ is not bound in } A_x^t!$$

As mentioned earlier (slide 23), you are not in risk of making that mistake as long as you adhere our convention: use *a*, *b*, *c*, for free variables!

Important note:

Recall that often you *apply* the rule from bottom to top!

- E.g., you might have some line X (i) $\exists y(y > a)$, and then
- you apply $\forall E$ to (i) to obtain: X (i-1) $\forall x \exists y(y > x)$!

Universal Introduction: Introduction

• For the *introduction* of the universal quantifier, we would like to have, conceptually, a rule like the following:

$$\frac{Fa \quad Fb \quad Fc \quad \dots}{\forall x \; Fx} \forall I$$

But that's again infeasible, and potentially even impossible!

Introduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers

Universal Introduction: Introduction

• For the *introduction* of the universal quantifier, we would like to have, conceptually, a rule like the following:

$$\frac{Fa \quad Fb \quad Fc \quad \dots}{\forall x \; Fx} \forall I$$

But that's again infeasible, and potentially even impossible!

How about: $Fa_{\forall x \ Fx} \forall f$? (as above, *a* is a constant)

That rule is wrong! Just because Aristotle is (was) a footballer, doesn't mean that everybody is!

But it might work for "typical objects"... (a variable)

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summa

- What's a typical object? (A free variable)
- Remember the "undergraduate school" when you have to proof some property of *all* triangles.
 - Step 1: Let ABC=

be a triangle.

- Step 2: "some fancy proof"
- Step 3: Thus, ABC has property P. Thus P holds for all triangles!
- Why is that correct? Since we did not make any assumptions for ABC other than it being a triangle! E.g., we did not demand that it has a 90-degree angle or any other special case! We gave it a name (ABC), but that was also arbitrary!

• So, we need an "object without any assumption" to generalize its property (formula) to the general case.

Introduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summary

- So, we need an "object without any assumption" to generalize its property (formula) to the general case.
- But how to express this "no assumptions"?

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers Summar

- So, we need an "object without any assumption" to generalize its property (formula) to the general case.
- But how to express this "no assumptions"?
- $\frac{Fv}{\forall x \ Fx} \forall I$ more general: $\frac{A}{\forall x \ A_v^x} \forall I$ with side condition:

provided the variable v does not occur in any assumption that A depends upon.

- So, we need an "object without any assumption" to generalize its property (formula) to the general case.
- But how to express this "no assumptions"?

•
$$\frac{Fv}{\forall x \ Fx} \forall I$$
 more general: $\frac{A}{\forall x \ A_v^x} \forall I$ with side condition:

provided the variable v does not occur in any assumption that A depends upon.

• Universal Introduction Rule: (in sequent notation)

$$\frac{X \vdash A}{X \vdash \forall x A_{\nu}^{x}} \forall I \quad \text{only if } \nu \text{ does not occur in } X!$$

Summary 00

Universal Introduction: More on our Assumption and Side-Conditions

So we have:
$$X \vdash A$$

 $\overline{X \vdash \forall x A_{\nu}^{x}} \forall I$ only if v does not occur in X !

So, can we use
$$\frac{Fv}{\forall x \ Fx} \forall I$$
 to prove $Faristotle \vdash \forall x \ Fx$?

Let's try!

Faristotle $\vdash \forall x \ Fx$

Universal Introduction: More on our Assumption and Side-Conditions

So we have:
$$X \vdash A$$

 $\overline{X \vdash \forall x A_{\nu}^{x}} \forall I$ only if v does not occur in X !

So, can we use
$$\frac{Fv}{\forall x \ Fx} \forall I$$
 to prove $Faristotle \vdash \forall x \ Fx$?

Let's try!

Faristotle $\vdash \forall x \ Fx$ α_1 (1)FaristotleA

Summary

Universal Introduction: More on our Assumption and Side-Conditions

So we have:
$$X \vdash A$$

 α_1 (n) $\forall x Fx$

 $X \vdash A$ -∀I $\overline{X \vdash \forall x \; A_v^x}$ Only if v does not occur in X!

Universal Introduction: More on our Assumption and Side-Conditions

So we have:
$$X \vdash A$$

 $\overline{X \vdash \forall x A_v^x} \forall I$ only if v does not occur in X !

So, can we use
$$\frac{Fv}{\forall x \ Fx} \forall I$$
 to prove $Faristotle \vdash \forall x \ Fx$?

Let's try! Does not work: Rule fails for two reasons!

Faristotle
$$\vdash \forall x \ Fx$$
 α_1 (1)FaristotleA

 α_1 (n) $\forall x Fx$

$$\frac{X \vdash A}{X \vdash \forall x A_v^x} \forall I$$
Only if v does
not occur in X!

Summary

Universal Introduction: More on our Assumption and Side-Conditions

So we have:
$$X \vdash A$$

 $\overline{X \vdash \forall x A_v^x} \forall I$ only if v does not occur in X !

So, can we use
$$\frac{Fv}{\forall x \ Fx} \forall I$$
 to prove $Faristotle \vdash \forall x \ Fx$?

- Two reasons this "proof" (luckily) fails:
 - The side condition states that *v* = aristotle (which is gets substituted) does not occur in *X*, but *X* is α₁ = Faristotle, so the side condition is violated.
 - Also, in our rule above v represents a variable. So it's not applicable here anyway. Recall: Just because Aristotle plays football, not everybody does!

5

Important:

- Note that the Logic Notes (and Yoshi as well!) refer to constants as "names".
- More importantly, note that we only use *a*, *b*, *c*, etc. as constants in the explanations for rules here in the lecture. For convenience, in all *exercises*, including those given in the lecture, these letters do *not* represent constants!
- Instead, in formal proofs, these letters (again: a, b, c, ...) will represent our "typical objects" – like the triangle ABC from before!
- These "typical objects" are (free, i.e., unbound) variables.
- In fact, you will never deal with constants in proofs!

 α_2 (2) $\neg Fa$ A

Why did we substitute y by b rather than by a?

- $X \vdash A$ corresponds to $\neg Fb$,
- The variable *v* in the rule (which is *b* in our case!) may not occur in *X*, which works for us since X = {α₁, α₂} = {∀x (Fx → ∀y Fy), ¬Fa}
- So choosing v = a would not have been possible, since a occurs in α₂ = ¬Fa!

$$\begin{array}{lll} \alpha_{1}, \alpha_{2} & (\text{n-3}) & \neg Fb \\ \alpha_{1}, \alpha_{2} & (\text{n-2}) & \forall y \neg Fy & (\text{n-3}) \forall I \\ \alpha_{1} & (\text{n-1}) & \neg Fa \rightarrow \forall y \neg Fy & (\text{n-2})[\alpha_{2}] \rightarrow I \\ \alpha_{1} & (\text{n}) & \forall x (\neg Fx \rightarrow \forall y \neg Fy) & (\text{n-1}) \forall I \end{array}$$

Universal Quantifiers

Existential Quantifiers

Summary

Existential Quantifiers

Pascal Bercher

 Recall that you can "imagine" the universal quantifier ∀ like: age(a) < 130 ∧ age(b) < 130 ∧ age(c) < 130 ∧ ...

- Recall that you can "imagine" the universal quantifier ∀ like: age(a) < 130 ∧ age(b) < 130 ∧ age(c) < 130 ∧ ...
- The existential quantifier ∃ can similarly interpreted as: age(a) > 100 ∨ age(b) > 100 ∨ age(c) > 100 ∨ ...

- Recall that you can "imagine" the universal quantifier ∀ like: age(a) < 130 ∧ age(b) < 130 ∧ age(c) < 130 ∧ ...
- The existential quantifier ∃ can similarly interpreted as: age(a) > 100 ∨ age(b) > 100 ∨ age(c) > 100 ∨ ...
- Thus, conceptually, we would expect something like the following rule:
 (a, b, ... are again constants)

$$\frac{Fa \lor Fb \lor Fc \lor \dots}{\exists x \ Fx} \exists I$$

Existential Introduction: The 1-step Rule (part I)

• Existential Introduction Rule:

$$\frac{Fv}{\exists x \ Fx} \exists I \text{ more general:} \quad \frac{A_x^t}{\exists x \ A} \exists I \text{ notation:} \quad \frac{X \vdash A_x^t}{X \vdash \exists x \ A} \exists I$$

Existential Introduction: The 1-step Rule (part I)

• Existential Introduction Rule:

$$\frac{F_V}{\exists x \ F_X} \exists I \text{ more general:} \quad \frac{A_x^t}{\exists x \ A} \exists I \text{ notation:} \quad \frac{X \vdash A_x^t}{X \vdash \exists x \ A} \exists I$$

• This rule assumes a non-empty "universe" (the objects that we reason about, more later when we formally deal with the semantics), i.e., that there exists at least one "object" that the terms represent. This is one of several assumptions in *classical logic*, though there are other important properties as well.

Existential Introduction: The 1-step Rule (part I)

• Existential Introduction Rule:

$$\frac{F_V}{\exists x \ F_X} \exists I \text{ more general:} \quad \frac{A_x^t}{\exists x \ A} \exists I \text{ notation:} \quad \frac{X \vdash A_x^t}{X \vdash \exists x \ A} \exists I$$

- This rule assumes a non-empty "universe" (the objects that we reason about, more later when we formally deal with the semantics), i.e., that there exists at least one "object" that the terms represent. This is one of several assumptions in *classical logic*, though there are other important properties as well.
- Just like ∀E, this rule also has a side condition!
 Let's see in an example which and why.

F

Assume we had no side condition:

$$A_x^t \xrightarrow{A_x} \exists l$$
 in sequent notation:

$$\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I$$

Existential Quantifiers

Let's consider this sequent: $\forall y (y = y) \vdash \exists x \forall y (y = x)$

• Should that be valid? No! There is not just one number! :)

Assume we had no side condition:

$$\frac{A_x^t}{\exists x \ A} \exists l \qquad \text{in sequent notation:}$$

$$\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I$$

Let's consider this sequent: $\forall y (y = y) \vdash \exists x \forall y (y = x)$

- Should that be valid? No! There is not just one number! :)
- But we can prove it! (If there's no side condition!)

 α_1 (1) $\forall y (y = y)$ A

Natural Ded

Assume we had no side condition:

$$\frac{A_x^t}{\exists x \ A} \exists l \qquad \text{in sequent notation:}$$

$$\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I$$

Let's consider this sequent: $\forall y (y = y) \vdash \exists x \forall y (y = x)$

- Should that be valid? No! There is not just one number! :)
- But we can prove it! (If there's no side condition!)

$$\begin{array}{ll} \alpha_1 & (1) & \forall y \ (y = y) & \mathsf{A} \\ \alpha_1 & (2) & \exists x \forall y \ (y = x) & 1 \\ \end{array}$$

Assume we had no side condition:

$$\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I$$

Existential Quantifiers

Let's consider this sequent: $\forall y (y = y) \vdash \exists x \forall y (y = x)$

- Should that be valid? No! There is not just one number! :)
- But we can prove it! (If there's no side condition!) $A_x^t \equiv A_x^y$

$$\begin{array}{ll} \alpha_1 & (1) & \forall y \left(y = y \right) & \mathsf{A} \\ \alpha_1 & (2) & \exists x \forall y \left(y = x \right) & 1 \exists I \end{array}$$

So what's the problem?

- We were quantifying an already bound variable! (The right y.)
- We were missing: The x in A must be free (as y) in A_x^y .
- Not any issue at all as long as you follow our convention!

So, in conclusion:

Existential Introduction Rule:

$$\frac{X \vdash A_x^t}{X \vdash \exists x \ A} \exists l \quad \text{only if } t \text{ is not bound in } A_x^t$$

As mentioned earlier (slide 23), you are not in risk of making that wrong as long as you adhere our convention: use *a*, *b*, *c*, for free variables!

So, in conclusion:

Existential Introduction Rule:

$$\frac{X \vdash A_x^t}{X \vdash \exists x \ A} \exists l \quad \text{only if } t \text{ is not bound in } A_x^t$$

As mentioned earlier (slide 23), you are not in risk of making that wrong as long as you adhere our convention: use *a*, *b*, *c*, for free variables!

Important note:

Recall that often you *apply* the rule from bottom to top!

- E.g., you might have some line X (i) $\exists y (Fa \rightarrow Fy)$, and then
- you apply $\exists I$ to (i) to obtain: X (i-1) $Fa \rightarrow Fa$!

Existential Quantifiers

Existential Elimination: Introduction

• We want to *eliminate* the existential quantifier. So can we just use

the following rule?
$$\frac{\exists x \ Fx}{Fv} \exists E$$
? Recall: $\frac{\forall x \ Fx}{Fv} \forall E$!

ntroduction Predicate Logic Natural Deduction Universal Quantifiers Existential Quantifiers

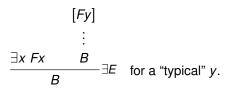

• We want to eliminate the existential quantifier. So can we just use

the following rule?
$$\frac{\exists x \ Fx}{Fv} \exists E$$
? Recall: $\frac{\forall x \ Fx}{Fv} \forall E$!

 So, no! Because we don't know *which* object has that property! (You can try to "prove" some invalid sequent when having this (wrong) rule available!)

• The *idea* behind the rule is the following:

- The idea is similar to disjunction elimination: In A ∨ B, we don't know whether A or B is true, so we assume both and show that either way the derivation can be done.
- Here, we show it for "some instance" that does not pose further restrictions (and then discharge it since we know that such an "instance" exists due to the assumption $\exists x \ Fx$).

Existential Elimination: The 1-step Rule

Existential Elimination Rule:

$$\frac{X \vdash \exists x \; A_t^x \quad Y, A \vdash B}{X, Y \vdash B} \exists E$$

Provided *t* does not occur in *B* or any formula in *Y*.

Existential Quantifiers

 Note what's written here: The assumption formula A in sequent 2 can be regarded an "instantiation" of the derivation in sequent 1 by substituting x by a term.

Existential Elimination: The 1-step Rule

Existential Elimination Rule:

$$\frac{X \vdash \exists x \; A_t^x \quad Y, A \vdash B}{X, Y \vdash B} \exists E$$

Provided t does not occur in B or any formula in Y.

Existential Quantifiers

- Note what's written here: The assumption formula A in sequent 2 can be regarded an "instantiation" of the derivation in sequent 1 by substituting x by a term.
- We need the side condition so that our choice of the "instance" of *x* is still "general".
- Otherwise we might be able to derive simply because we chose a specific special case!
- Again, you can try to prove an invalid sequent, which you might be able to if you violate that side condition!

Existential Quantifiers

roduction	Predicate Logic	Natural Deduction	Universal Quantifiers	Existential Quantifiers	- 20
Examp	les: Example 1				
	$ \vdash \forall x \exists y (Fx \rightarrow \alpha_1 (1) Fa \\ (2) Fa - (2) Fa$	Fy) → Fa	A 1[α_1] \rightarrow /	$\frac{X \vdash A}{X \vdash \forall x \; A_v^x} \forall I$ Only if v does not occur in X!	
				not occur in X!	1

$$\begin{array}{ll} (n\text{-}1) & \exists y \ (Fa \to Fy) \\ (n) & \forall x \ \exists y \ (Fx \to Fy) & (n\text{-}1) \ \forall I \end{array}$$

 $\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I$

Examples: Example 1

$$\vdash \forall x \exists y (Fx \to Fy)$$

$$\alpha_1 \quad (1) \quad Fa \qquad A \\ (2) \quad Fa \to Fa \qquad 1[\alpha_1] \to I \\ (3) \quad \exists y (Fa \to Fy) \qquad 2 \exists I$$

$$\begin{array}{ll} (n-1) & \exists y \ (Fa \to Fy) \\ (n) & \forall x \ \exists y \ (Fx \to Fy) & (n-1) \ \forall x \end{array}$$

$$\frac{X \vdash A}{X \vdash \forall x \; A_v^x} \forall I$$
Only if v does
not occur in X!

$$\boxed{\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I}$$

• Wait a minute! Didn't we say that A_x^t replaces *all* occurrences of *x* in *A* by *t*?

So, going from line (2) $Fa \rightarrow Fa$ to line (3) $\exists y (Fa \rightarrow Fy)$ is wrong, right?

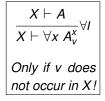

Examples: Example 1

$$\vdash \forall x \exists y (Fx \to Fy)$$

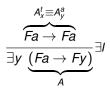

$$\alpha_1 \quad (1) \quad Fa \qquad A \\ (2) \quad Fa \to Fa \qquad 1[\alpha_1] \to A \\ (3) \quad \exists y (Fa \to Fy) \qquad 2 \exists I$$

$$\begin{array}{ll} (n-1) & \exists y \ (Fa \to Fy) \\ (n) & \forall x \ \exists y \ (Fx \to Fy) & (n-1) \ \forall x \end{array}$$

So, going from line (2) $Fa \rightarrow Fa$ to line (3) $\exists y (Fa \rightarrow Fy)$ is wrong, right?

• No! We did replace all x (here: y) by t (here: a)! (See illustration.)

$$\vdash \forall x \exists y \ (Fx \to Fy)$$

$$\frac{X \vdash A}{X \vdash \forall x \; A_v^x} \forall I$$
Only if v does
not occur in X!

$$\boxed{\frac{X \vdash A_x^t}{X \vdash \exists x \; A} \exists I}$$

B or any formula in Y.

Remember from the beginning:

- All logicians are rational
- Some philosophers are not rational
- Thus, not all philosophers are logicians

Now, in our unsorted predicate logic, this is:

- All logicians are rational
- Some philosophers are not rational
- Thus, not all philosophers are logicians

 $\forall (x : Lx) Rx \\ \exists (x : Px) \neg Rx \\ \neg \forall (x : Px) Lx \end{cases}$

 $\forall x \ Lx \to Rx \\ \exists x \ Px \land \neg Rx \\ \neg \forall x \ Px \to Lx$

 $\forall x \ Lx \rightarrow Rx, \exists x \ Px \land \neg Rx \vdash \neg \forall x \ Px \rightarrow Lx$

$$\forall x \ Lx \rightarrow Rx, \exists x \ Px \land \neg Rx \vdash \neg \forall x \ Px \rightarrow Lx$$

Summary

Summary

Universal Quantifier

xistential Quantifier

Summary

- We introduced predicate logic:
 - with restricted quantifiers (we re-visit this later)
 - and with unrestricted quantifiers (default!)

Universal Quantifier

Existential Quantifier

Summary

- We introduced predicate logic:
 - with restricted quantifiers (we re-visit this later)
 - and with unrestricted quantifiers (default!)
- Predicate logic can reason about objects!

Universal Quantifier

- We introduced predicate logic:
 - with restricted quantifiers (we re-visit this later)
 - and with unrestricted quantifiers (default!)
- Predicate logic can reason about objects!
- Natural deduction for predicate logics, with additional rules for:
 - Introduction and Elimination rules for \forall and \exists
 - For the rest we keep using the rules from propositional logics!

Universal Quantifiers

- We introduced predicate logic:
